ribosomal protein L10.e, cytosolic - common tobacco (fragment)
N;Alternate names: WILM's tumor-related protein HUMOM
C;Species: Nicotiana tabacum (common tobacco)
C;Date: Neb-1995 #sequence_revision 06-Dec-1996 #text_change 18-Aug-2000
C;Accession: S44144
R;Meyer, Y.
submitted to the EMBL Data Library, July 1992
A;Description: Growth-related gene expression in Nicotiana tabacum mesophyll protoplasts.
A;Reference number: S29905
A;Accession: S44144

Sequence 78, Application US/08160604
Patent No. 623252
GENERAL INFORMATION:
APPLICANT: Harley, John
APPLICANT: James, Judith A.
APPLICANT: Scotield, R. H.
TITLE OF INVENTION: PEPTIDE INDUCTION OF AUTOIMMUNITYAND CLINICAL SYMPTOMATOLOGY
NUMBER OF SEQUENCES: 127
CORRESPONDENCE ADDRESS:
ADDRESSEE: Patrea L. Pabet
STREET: 1100 Peachtree Street, Suite 2800

Patent No. 5583210
GENERAL INFORMATION:
APPLICANT: NEILL, John
APPLICANT: CIGAN, Andrew M.
TITLE OF INVENTION: Methods and Compositions for Controlling
TITLE OF INVENTION: Plant Development
NUMBER OF SEQUENCES: 5
CORRESPONDENCES: 5
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Length 16;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0; Indels

Saliva immunoassay for detection of antibodies for autoimmune disease, e.g. lupus, in patient, by determining level of antibodies against autoantigen, and comparing level of determined antibodies with normal levels of antibodies.

Example 8; Page 7; 16pp; English

This invention relates to a novel saliva immunoassay for diagnosing an autoimmune disease in a patient. Specifically, the method determines the level of antibodies that are present against the autoantigens for a particular autoimmune disease and compares these results with normal level to determine the likelihood or severity of such a disease. The test comprises a highly sensitive and accurate ELISA (enzyme-linked immunosorbant assay) that measures saliva IgA specific antibody titres against the purified antigens or a corresponding recombinant antigen or synthetic peptide of an autoantigen, where the autoantigens are lugus peptides, arthritis peptides, platelet glycoprotein or immune complexes. As such, this single test can be used to accurately detect antibodies for

The invention discloses numbar addression molecule polypeptices (designated ABSS) ADS1, ADS2 and ADSS which have the NCBI Genebank accession numbers, and also termed, AAC74884.1, AAC76788.1 and Pl0155, respectively.

Adhesion molecules are involved in a wide range of biological processes from embryogenesis to approase. They are essential to the structural integrity and homeostatic functioning of most tissues and, therefore, defects can play a role in many disease processes. Alteration of their activity is a means to alter the disease processes. Alteration of their activity is a means to alter the disease processes. Alteration of their activity is a means to alter the disease processes. Alteration of their activity, for diagnosing a disease in a patient, in a dwhich preferably inhibit, the adhesion molecule activity to identify compounds that either increase or decrease the level of expression or activity, for diagnosing a disease in a patient, in a decrease the level of pharmaceutical composition, as a vaccine, for monitoring the therapeutic treatment of disease in a patient, for creating transgenic or knockout and for screening a compound effective for treating a disease. The ADS colypeptides, nucleic acids, vectors, ligands, compounds or pharmaceutical compositions are useful for treating or diagnosing colorectal or brain tumours), metastasis, inflammatory diseases (e.g. thrombosis) and core (e.g. lung, procetate, breast, or thinitis), astromosis), cancer (e.g. lung, procetate, breast, or thinitis), astromomestianal diseases (e.g. lung, procetate, breast, or theumacoid arthritis, transplant rejection or altersy), liver diseases (e.g. cirrhosis), inflammatory diseases (e.g. atthma, chronic obstructive pulmonary disease (cop), respiratory diseases (e.g. attended or pulmonary fibrosis), inflammatory diseases (e.g. autoimmune diseases (e.g. osteoporoais), immune diseases (e.g. autoimmune diseases (e.g. osteoporoais), neurological diseases (e.g. osteoporoais), and processed (e.g. autoimmune diseases (e.g. osteopor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antigen; human; SSA60; ribonucleoprotein; autoimmune disease; diagnosis; lupus erythematosus; Sjorgen's syndrome A.

This invention describes a novel method for the recombinant production of ribonucleoprotein (1) which comprises producing a prokaryotic host cell that contains at least one DNA (II) encoding an RNA component of (I) and at least one DNA (III) encoding a protein component of (I), expressing both DNAs and then recovering (I). The invention also describes (1) nucleic acid constructs containing (II) and (III); (2) recombinant prokaryotic cell containing (II) and (III); (3) (1) produced by the new method; and (4) SSA60 protein, designated M56, having a 553 amino acid (aa) sequence, given in the specification, optionally in association with RNA. (I) are used for diagnosis/prognosis of autoimmune diseases,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antigen; human; SSA60; ribonucleoprotein; autoimmune disease; diagnosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               especially systemic lupus erythematosus or Sjorgen's syndrome A, by complex formation with (I)-especific antibodies. (I) are produced simply, inexpensively and on a large scale, in a functional (immunologically active) form that provides a reliable diagnostic test. Complete (I) are
                                                                                                                                                                                                                                           Recombinant production of ribonucleoprotein, useful for diagnosis of autoimmune disease, by expressing, in prokaryotes, sequences encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Recombinant production of ribonucleoprotein, useful for diagnosis of autoimmune disease, by expressing, in prokaryotes, sequences encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         more selective and sensitive than the protein component used alone, whether recombinant or isolated from bovine spleen

Primer sets for synthesizing polynucleotides, particularly the 5602 full length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length

Claim 8; SEQ ID NO 16064; 2537pp + Sequence Listing; English.

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of

```
the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polymucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs as asily without any specialised methods. AAH13616 to AAH13628 and AAH13631 to AAH13612 represent human cDNA sequences; and AAH13622 to AAH13622 represent oligonucleotides, all of which are used in the exemplification of the

New linear epitope(s) for human auto-antibodies - from the Ro/SSA, and Sm B/B' antigens and ribo:nucleoprotein, used for diagnosing an treating auto-immune disorders e.g. systemic lupus erythematosus.

Claim 1; Page 31; 43pp; English

The sequences given in AAR43391-562 are linear epitopes which are derived from the 60 kD Ro/SSA peptide, the La/SSB autoantigen, the 70 kD nuclear ribonucleoprotein (nRWP) and the SW B/B' polypeptide. These antigens are common in systemic lupus expthematosus (SLE) and closely related disorders. The Ro/SSA family of proteins has been shown to have several molecular forms which are defined by the molecular weight of the antigen identified. The major form have molecular weights of \$2 and \$4 kD. La/SSB is also a dditional forms have molecular weights of \$2 and \$4 kD. La/SSB is also a member of this group of autoantibodies and binds small RNAs with a polyuridine terminus. La/SSB is bound by a third of the anti-Ro/SSA precipitin positive sera. La/SSB has been shown to be a \$46-50 kD monomeric phosphoprotein which associates with RNA polymerase III

The protein has a molecular weight of 9.13 Kb. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic applications. Transcription termination factor binding protein 9.13 can be used in the treatment of a variety of diseases such as cancer and HIV (human immunodeficiency virus) infection. The present sequence represents human transcription termination factor binding protein 9.13
transcripts. Anti-Sm antibodies precipitate snRNPs containing the U1, U2 U4/U6 and U5 RNA. Anti-Sm antibodies may be directed against one or a combination of the polypeptides: B (26 kD), B'(27 kD), D (13 kD), E/F (11 kD doublet) and G (less than 10 kD). These epitopes may be used for preventing, treating or screening autoimmune disorders, especially SLE Sjoarens syndrome (SS). They bind to a human autoantibody and may therefore be used as vaccines. The patent discloses a specific method of generating an animal model of systemic lupus erythematosus (SLE), comprising immunising a non-human cannimal with non-immunoglobulin peptide which comprises an epitope immunoreactive with auto-antibody (AAA) from patient with SLE. The epitope includes a region of self-antigen which is bound by AAD comprises an epitope includes a region of self-antigen which is bound by AAD comprises an enimal model of SLE. It is useful for screening an animal model of SLE. It is useful for screening the reapoutics effective in treating autoimmune disorders. It is useful as a component in a diagnostic assay, as a therapeutic (vaccine to block the AADS produced, by eliciting immune response), and in research on the possible causes of the autoimmune response, once autoimmunity against the autoantigen is established. The amino acid sequences are used to make agents for neutralising circulating antibodies or immobilised on substrates in extraorporeal devices for specific removal of AADS. The reagents identified by using the method are useful in manufacturing and testing autoantigens. The method are useful in manufacturing and testing autoantigens. The method is useful as models for screening of compounds which induce autoimmunity, inhibit induction of autoimmunity, consuperated from human ribo-nucleoprotein, 60 kD Ro/SSA. This peptide is used in the exemplification of the invention

Generating systemic lupus erythematosus animal model by immunizing non-human animal with non-immunoglobulin peptide having amino acid sequence of self-antigen bound by autoantibody population in early stage of

Example 1; Col 16; 63pp; English.

The patent discloses a specific method of generating an animal model of systemic lupus erythematosus (SLE), comprising immunising a non-human animal with non-immunoglobulin peptide which comprises an epitope immunoreactive with auto-antibody (AAAb) from patient with SLE. The epitope includes a region of self-antigen which is bound by AAb population present in early stage in patient with SLE. The method is used for generating an animal model of SLE. It is useful for screening a component in a diagnostic assay, as a therapeutic (vaccine to block the AAbs produced, by eliciting immune response), and in research on the possible causes of the autoimmune diseases. The method is used to interrupt the course of an autoimmune ciesponse, once autoimmunity against the autoantigen is established. The amino acid sequences are used to make gents for neutralising circulating antibodies or immobilised on substrates in extracorporeal devices for specific removal of AAbs. The reagents identified by using the method are useful in manufacturing and compounds which induce autoimmunity, inhibit induction of autoimmunity, suppress autoimmunity. It is useful in disorders. The present autoimmune disorders. The present ribo- nucleoprotein, 60 kD Ro/SSA. This sequence is a peptide from human ribo- nucleoprotein, of peptide is used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                14-MAY-1999
                                                                                                                  06-SEP-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   19-MAY-19
20-MAY-19
21-MAY-19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               25-MAY-1
ö
                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA01310) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, laukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                           Isolated nucleic acids and polypeptides, useful for preventing diagnosing
                                                                                                                                      Human, cytokine, cell proliferation, cell differentiation, gene therapy, vaccine, peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer, leukaemia; nervous system disorders; arrhritis; inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                                      Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence; corn.
                                                                                                                                                                                     The sequence is that of a developmental protein in a plant which is encoded by a DNA sequence capable of hybridising to a mammalian QM gene. The DNA can be used to transform plants to alter normal development and to produce male sterile plants, e.g. for the prodn. of hybrid seeds. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                    Polynucleotide(s) encoding a QM-type protein in plants - used to transform plants to alter normal development partic. for producing male sterile plants.
                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                          -i- FUNCTION: Required for the retention of luminal endoplasmic reticulum proteins. Determines the specificity of the luminal ER protein retention system. Also required for normal vesicular traffic through the Golgi (By similarity).
-i- SUBCELLULAR LOCATION: Integral membrane protein.
-i- SIMILARITY: Belongs to the ERD2 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

J. Mol. Bvol. Stand psaB bind P700, the primary electron donor of photosystem I (PSI), as well as the electron acceptors A0, A1 and FX. PSI is a plastocyanin/cytochrome c6-ferredoxin oxidoreductase, converting photonic excitation into a charge separation, which transfers an electron from the donor P700 chlorophyll pair to the spectroscopically characterized acceptors A0, A1, FX, FA and FB in

turn. Oxidized P700 is reduced on the lumenal side of the thylakoid membrane by plastocyanin or cytochrome c6. COFACTOR: P700 is a chlorophyll A/chlorophyll A/ dimer, A0 is one or more chlorophyll A, Al is one or both phylloquinones and FX is a shared 4Fe-4S iron-sulfur center (By similarity). SUBDNIT: The psaA/B heterodimer binds the P700 chlorophyll special pair and subsequent electron acceptors. PSI consists of a core antenna complex that captures photons, and an electron transfer chain that converts photonic excitation into a charge separation. The eukaryotic PSI reaction center is composed of at least 11 subunits (By similarity). SUBCELLUMAR LOCATION: Integral membrane protein. Chloroplast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           IRON-SULFUR (4FE-4S) (SHARED WITH DIMERIC PARTNER) (BY SIMILARITY).

The plastid genome of the cryptophyte alga, Guillardia theta:

The plastid genome of the cryptophyte alga, Guillardia theta:

The plastid genome of the cryptophyte alga, Guillardia theta:

The plastid genome of the cryptophyte alga, Guillardia theta:

The plastid genome of the cryptophyte alga, Guillardia theta:

The plastid genome of the cryptophyte alga, Guillardia its common and the falga.

The plastid genome of the cryptophyte alga, Guillardia its common of the falga.

The plastid genome of the clastic falga.

The plastid genome of the clastic falga is a plastocyanin/cytochrome of chorophyll pair to the spectroscopically characterized acceptors A0, Al. FX. FA and FB in the converting photonic excitation into a charge separation, which than of converting photonic and the lumenal side of the spectroscopically characterized acceptors A0, Al. FX. FA and FB in the convertion of the lumenal side of the convertion acceptors.

The eukaryotic FSI reaction center is composed of at least 11 subunits (By similarity).

The plastid and converts photonic excitation into a charge separation.

The eukaryotic FSI reaction center is composed of at least 11 subunits (By similarity).

Patent No. 6551795

GENERAL INFORMATION:

GENERAL INFORMATION:

TITLE OF INVENTION: AREUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: AREUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION WINDER: US/09/252,991A

CURRENT APPLICATION WUNBER: US 60/074,788

PRIOR PAPLICATION WUNBER: US 60/074,788

PRIOR FILING DATE: 1999-02-18

PRIOR FILING DATE: 1999-02-18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

Patent No. 6610836

GENERAL INFORMATION:
APPLICANT: GATY Breton et. al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: NUEMBER: US/09/489,039A

TITLE OF INVENTION: NUMBER: US/09/489,039A

CURRENT APPLICATION NUMBER: US/09/489,039A

CURRENT FILING DATE: 1999-01-27

PRIOR PLING DATE: 1999-01-29

NUMBER OF SEQ ID NOS: 14342

SEQ ID NO 12721

LENGTH: 641
                                                                                                                                                                                                                                                               .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 25304, Application US/09252991A
Patent No. 6551795
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS;
TITLE OF INVENTION: ABRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILLE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
                                                                                                                                                                                       Sequence 12, Application US/08311731A
Patent No. 658326
GENERAL INFORMATION:
APPLICANT: SMITH, DOUGLAS

Saliva immunoassay for detection of antibodies for autoimmune disease, e.g. lupus, in patient, by determining level of antibodies against autoantigen, and comparing level of determined antibodies with normal levels of antibodies

Example 8; Page 7; 16pp; English.

This invention relates to a novel saliva immunoassay for diagnosing an autoimmune disease in a patient. Specifically, the method determines the level of antibodies that are present against the autoantigens for a particular autoimmune disease and compares these results with normal tevels to determine the likelihood or severity of such a disease. The test comprises a highly sensitive and accurate ELISA (enzyme-linked immunosorbant assay) that measures saliva IgA specific antibody titres against the purified antigens or a corresponding recombinant antigen or synthetic peptide of an autoantigen, where the autoantigens are lupus peptides, arthritis peptides, platelet glycoprotein or immune complexes. As such, this single test can be used to accurately detect antibodies for

The present sequence represents a variable light chain CDR3 mutant C6ML3-

4 modified from the derived light chain variable region of the C6 human

antibody C6.5. The mutant C6ML3-4 specifically binds to c-erbB-2.

2 chimeric molecule that binds specifically to tumour cells carrying c-erbB-2.

3 consists of an effector compound attached to a C6 human antibody. If

4 the effector compound is a cyctoxin the chimeric molecule can be used to

5 inhibit growth of c-erbB-2 positive tumours (especially breast and other

6 can be used to detect such cells, including in vivo localisation. The

7 carcinomas). If the effector compound is a label the chimeric molecule

7 can be used to detect such cells, including in vivo localisation. The

8 can also be used for diagnosis/localisation, in vivo or in

8 viro, especially by immunoassay. The nucleic acid encoding the antibody,

8 and a nucleic acid encoding a single chain polypeptide with the binding

8 specificity of the antibody and comprising the binding portions of

8 specificity of the antibody and comprising the binding portions of

8 variable regions of light and heavy chains of the antibody, joined by a

8 linker, can be used to produce recombinant proteins by standard methods.

9 Unlike known anti-c-erbB-2 antibodies, C6 antibodies are fully human, so

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain recaction (PGR) primers, oligomers, and for chomosome and gene mapping, and in recombinant production of (II). The polymuclectides are also used in diagnostics as expressed sequence tags for identifying expressed cerivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating of supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biddiversity and to produce other types of data and products dependent on DNA and amino acid sequences of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this amino acid sequences of the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Neisseria meningitidis, Neisseria gonorrheae; antigen, vaccine;
antigenic, diagnosis; immunogenic; infection; meningitis; septicaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Weisseria meningitidis ORF 212 protein sequence SEQ ID NO:738.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SXXXXXXXXXXXXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating of supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity responsible for genetic disorders or other traits to assess biodiversity amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention.                                                                                                                                                                                                                                                                                                                                                                                                                                   AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY5941 represent novel Neiseeria meningitis and N. gonorrheae polymucleotides and polypeptides. AAZ54578 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polymucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseriat, or to raise antibodies. They may also be used to screen for agonists or the polymucleotides of the invention may also be used in gene therapy protocols

The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, noticably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                           Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; foetal liver; gene expression; single exon nucleic acid probe.

Protein #7956 encoded by probe for measuring heart cell gene expression.
such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders

                                                                                                                                                                                                                                                                                                                              d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                               The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formadirectly from WIPO at ftp.wipo.int/pub/published_pct_sequences

measuring human gene expression in a sample derived from human heart (see MBA21535-ABA4105). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Note: The sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed at flowipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to single exon nucleic acid probes for

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention
                                                    Human; brain expressed exon; gene expression analysis; probe; microarray; Alzheimer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer.
                    Human brain expressed single exon probe encoded protein SEQ ID NO: 35574
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; liver; cirrhosis; hyperlipoproteinaemia; hyperlipidaemia; hypercholesterolaemia; coronary heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 4; SEQ ID NO 35574; 650pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as 1ymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human genome-derived single exon nucleic acid probes useful for analyzing

Comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlippiatementa, hyperlippidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from MIPO at fitp.wipo.int/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample cerved from human lung, comprising (a) contacting the array with a acid expressed in the human lung; measuring gene expression in a sample collection of detectably labeled mucleic acids derived from human lung array; identifying exons in a eukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably labeled mucleic acids from eukaryote lung mRNA, to a single exon probe, the eukaryote; and (b) detecting specific hybridisation of detectably labeled mucleic acids from eukaryote lung mRNA, to a single exon probe, in the above mentioned microarray; assigning exons to a single exon probe, in the above mentioned microarray; assigning exons to a single exon comprising of in the above and (b) measuring the expression of each of the exons in several comprising the exons should be assigned to a single gene; a peptide comprising one of 12011 sequences, mentioned in the specification, or encoded by the expression confirmation or encoded by the expression confirmation or encoded by the expression cung derived manalysis, and for identifying exons in a gene, particularly using human lung ender, chronic obstructive pulmonary diseases such as asthma, lung cancer, chronic obstructive pulmonary diseases such as asthma, lung cancer, chronic obstructive pulmonary diseases such as asthma, lung cancer, chronic obstructive pulmonary diseases such as asterma, lung derived manalysis, and for the expression and encoded and the expression of the expective pulmo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cancer, chronic obstructive pulmonary disease (COPD), interstitial lung disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis, tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pudlak syndrome, Sarcoidosis, pulmonary haemosiderosis, pulmonary histiocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis, Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertension and hypaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), proteins (ABB77737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
